

Amendments to the Claims:

This listing of claims will replace all prior versions, and listings, of claims in the application:

Listing of Claims:

1-8 (Cancelled).

9. (Currently Amended) A fault management system for a switching equipment which includes a circuit section connected to an external terminal equipment over a communication circuit, a switch section for communicating data ~~which-with~~ said circuit section, and a processor for performing setting and control of said circuit section, protocol processing of a transmission/reception packet and other ~~necessary~~ processing over a processor bus, comprising:

a clock fault detection section for supervising the normality of an oscillator for supplying a clock signal to said processor and detecting whether or not supply of a clock signal from ~~an~~ said oscillator ~~is interrupted, for supplying the clock signal to said processor is interrupted,~~ and

a concentrated fault management section connected to said clock fault detection section and said processor bus for supervising the normality of said processor bus and continuously signaling, if a fault notification of the interruption of the supply of the clock signal is received from said clock fault detection section, a reset signal to said processor and said circuit section so that data in a data link layer or an upper layer may not flow from said processor or said circuit section and issuing a notification of occurrence of a fault to a central control section connected to an external console.
